

Ultimate Desktop to Data Center Flexibility

As data grows exponentially year after year, enterprises demand solutions that can keep up as workloads get more and more compute-intensive. And with the rising costs of servers and cloud providers, powerful workstations that can process data locally and more efficiently could mean vast improvements for productivity and business as a whole.

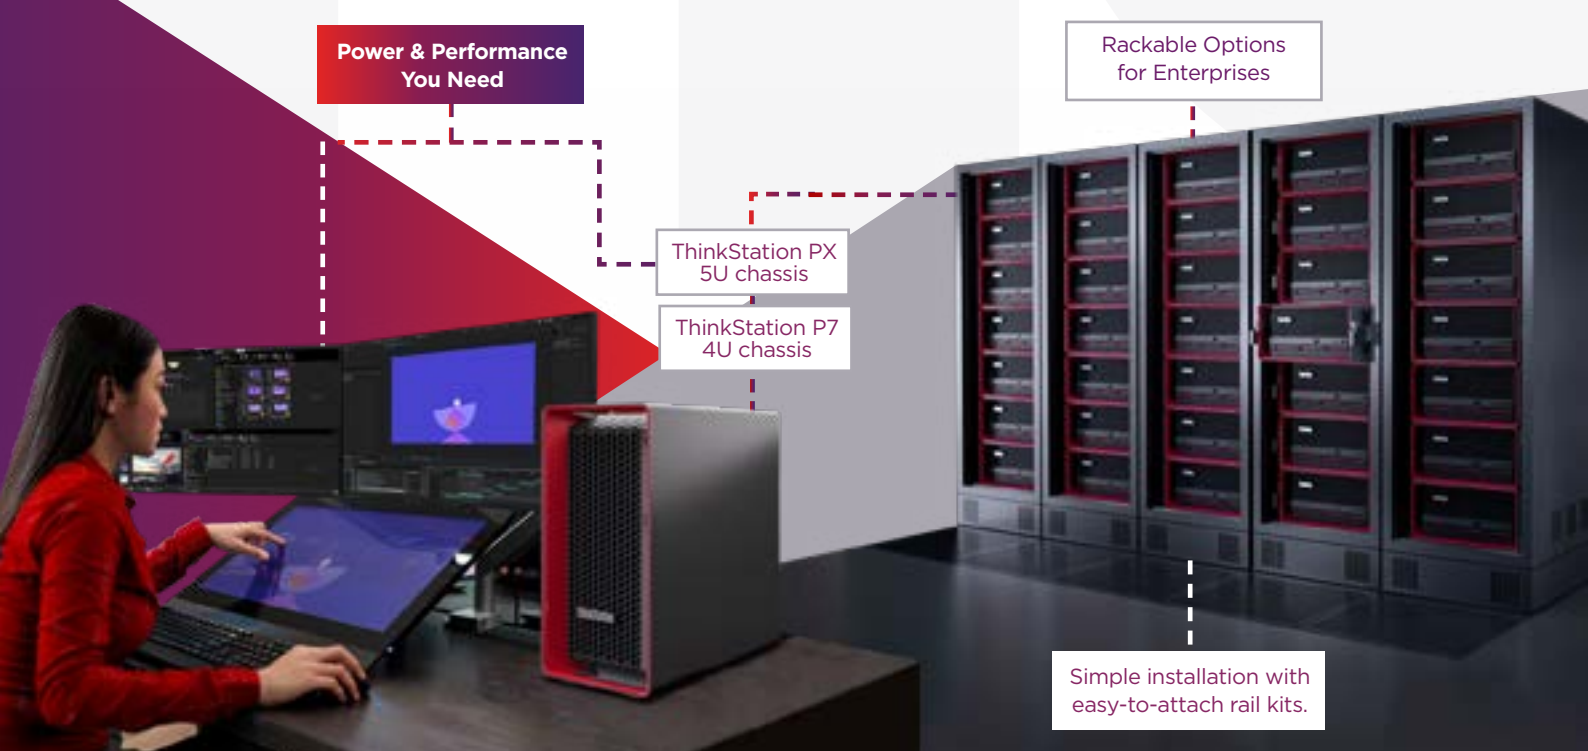

The **Lenovo ThinkStation PX** and **ThinkStation P7** are versatile workstations that offer flexibility for both desktop and data center environments.

ThinkStation desktop workstations tackle complex computing tasks that were traditionally reserved for cloud or server resources, while maintaining nondisruptive acoustics. Now, paired with proper data center features, managements tools, and remote visualization, these next-

generation ThinkStations bridge the gap where previous solutions fell short. Designed from the ground up to address workflow needs across industries, the ThinkStation PX and P7 systems provide full-spectrum coverage for office, remote, and hybrid enterprise environments.

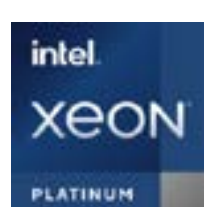

Rack-Optimized

Digital Transformation

The prevalence of hybrid and remote work calls for more powerful compute solutions.

With the support of up to four high-performance Intel® Xeon® Scalable processors, these new ThinkStations can accommodate collaborative virtual sessions better than ever before, acting as a powerful workstation host for multiple users.

Ease of Management and Serviceability

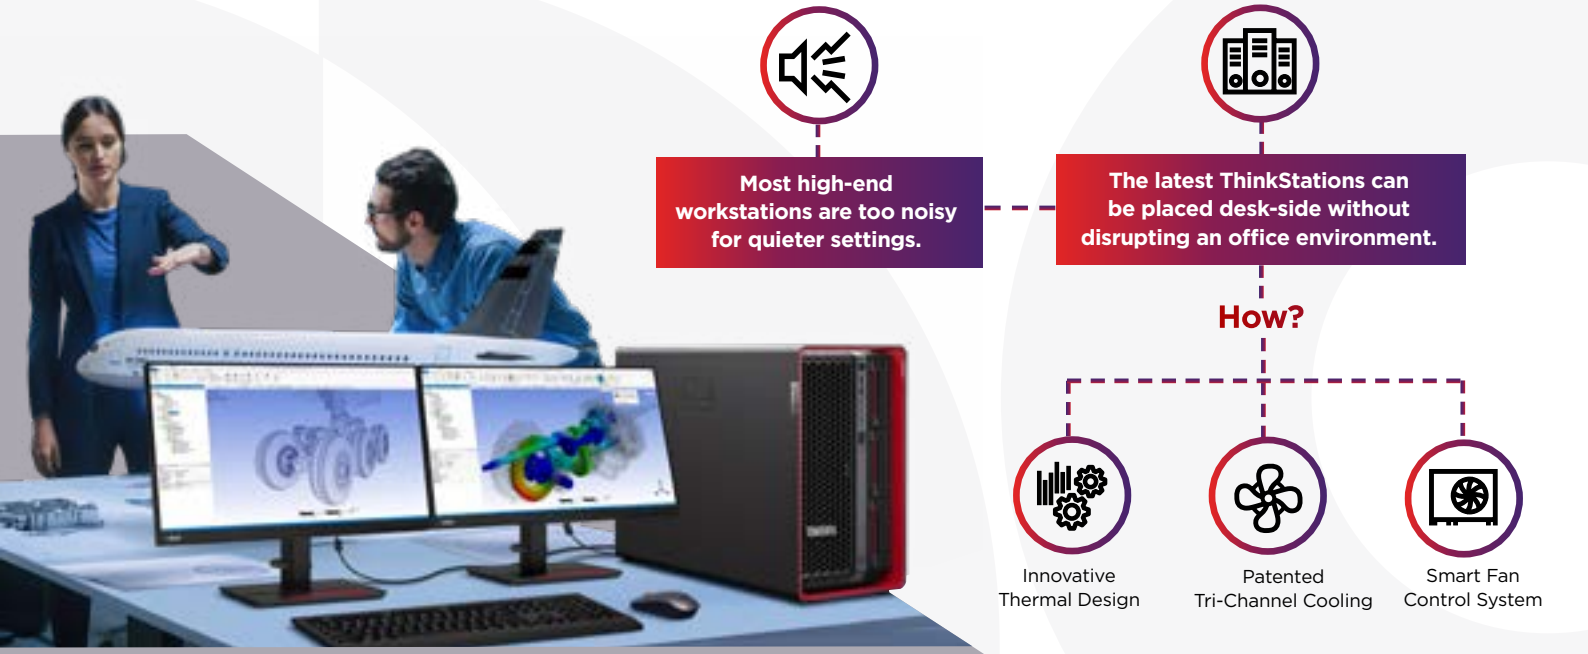

Reaffirming our commitment to tool-less accessibility, our newest ThinkStations now feature hot-swap, front access drives in an innovative, modular design to easily address custom configuration and maintenance needs.

Dual Redundant Power Supplies

The **ThinkStation PX** offers peace of mind with dual redundant power supplies that can easily be moved in and out of the system. This option ensures stability in case of system failures or can be used in a teaming configuration to run more robust, high-performance workloads.

Nondisruptive Acoustics
